

INVESTMENT POLICY OF THE FUND

The purpose of the investment fund is to create an equity fund that seeks to benefit from innovation in various industries. The Fund aims to achieve long-term capital growth by investing in global companies that are at the forefront of the use of disruptive technologies and can thus play a leading role in their industries. Disruptive technology refers to innovations or developments that significantly change or disrupt existing industries, business models, products or services. Such trends include, for example, big data (artificial intelligence, cyber security, quantum computers), e-mobility (electric cars and related battery technologies), digitisation and related entertainment (metaverse, e-sports) and, last but not least, fintech and robotics industry breakthroughs.

The Fund aims to achieve its objectives through equity-type instruments, primarily exchange-traded funds (ETFs), equities and open-ended public investment funds. The Fund takes a forward-looking approach and actively seeks companies in industries that show potential for growth through technological innovation. Investments are made in companies that have strong fundamentals and are capable of long-term value creation and achieving competitive advantage through innovation. The investment philosophy is based on the belief that innovation is a key driver of long-term business success and shareholder value. Trends related to technological innovation are long-term processes that extend beyond normal economic cycles and are generally global and affect the entire world. Consequently, the Fund is not subject to any geographical restrictions. Since the Fund aims to profit from long-term growth and has significant exposure to the equity market, we recommend the Fund to investors who want to invest in the longer term and have a relatively high willingness to take risk.

MARKET SUMMARY

The Fund delivered strong performance, and we saw exciting developments in its focus areas in April as well. The index tracking the semiconductor sector achieved a record-breaking monthly performance, rising more than 40% in a single month. However, the rally was not led by Nvidia; its stock rose 22%, which is outstanding under normal circumstances but was modest compared to the rest of the sector. The surge was driven by beneficiaries of the CPU shortage emerging from the spread of agentic AI models. Intel's stock doubled during the month, reaching an all-time high for the first time since 2000, while AMD's shares rose by around 70%. The positive correction in the software sector lifted the year's most underperforming stocks. Software companies rose nearly 9% in April, but their relative underperformance compared to semiconductors was most pronounced this very month. This further deepened the K-shaped divergence in the AI market: while the infrastructure layer—chips, memory, optical interconnects—is racing ahead at a historic pace, the software and applications layer continues to search for a valuation floor in the shadow of AI disruption. In 2026, the technology sector produced one of the weakest relative returns of the past 50 years compared to global equities, while earnings expectations for the same sector are the most favorable. This has opened a record gap between the sector's earnings growth and its performance. At the end of April, five of the Magnificent 7 companies reported earnings on two consecutive nights. Confirming the vitality of the AI trend, all four hyperscalers further raised their capital expenditure forecasts, bringing their combined annual plans to nearly \$725 billion. The results delivered positive surprises, but market reactions varied sharply. Alphabet rose nearly 10% after its cloud services segment's revenue jumped 63% year-over-year. Amazon rose ~4% on figures that beat both EPS and revenue consensus, while Apple gained ~5% following the release of favorable third-quarter guidance at the market open. Despite a strong report, Microsoft fell nearly 4%, while Meta plunged ~9% after providing only consensus-level revenue forecasts alongside its increased \$125–145 billion investment plan. The market's message is clear: mere spending intentions are no longer enough; investors are looking for concrete evidence of a return on AI investments. In April, building on the favorable valuation and the company's strong market position, we slightly increased Microsoft's weight in the portfolio.
